

Plasma and LCD Televisions

Feel the difference of the world's leading technology. Imagine the perfect picture... LG brings imagination to life. The desire to bring the ultimate in picture and sound quality is something that LG lives for. LG has brought that desire to life by blending the latest technology with modern sleek changes to produce an outstanding award winning range of TVs.

The difference is ...

XD
ENGINE

XD Engine is LG's special Digital image generating chip. This latest release has been re-engineered to give truly realistic high definition images.

The image above shows the optimal screen image produced using the XD Engine processes.

The difference is ...

XD Engine
CrystalVue

CrystalVue improves picture quality by a new improved three stage process.

1. A technology that eliminates noise (Noise Reduction).

XD Engine 2005 was limited to noise reduction within only the current frame. XD Engine 2006 is now able to apply a 3-Step control mechanism by data analysis of the current, previous and next frame which allows for an improved flow of images.

2. A technology that effectively converts low resolution images into high resolution images to fit the screen size (HD Scaling).

This technology ties in with the noise reduction process where the 3-Step control mechanism scales the image accordingly to fit the screen whilst generating a clear and realistic image.

3. The new signal then increases in clarity by emphasizing edges and shapes (Edge Enhancement).

The end result of this is the edges are clearer and the images more distinct.

XD Engine
PurePalette

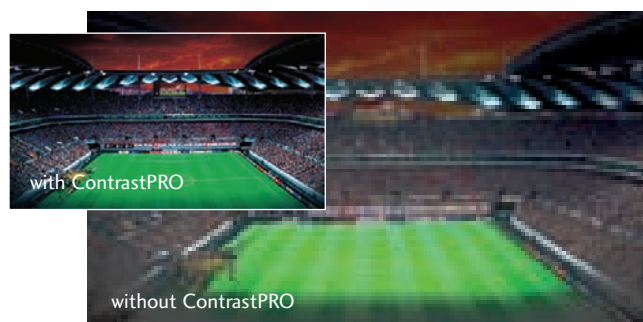

Like the equaliser of an audio system, PurePalette automatically controls images to reproduce the most natural skin tones and colours of any scene whilst maintaining a bright and vibrant picture.

XD Engine
ContrastPRO

This technology analyses the input signal and optimises the contrast by making dark areas darker and bright areas brighter.

The New XD Engine controls contrast of overall picture frame through the APL (Average Picture Level), each image's Dynamic Range is identified and extended to produce a more bright, delicate and detailed image.

XD Engine
VistaBright

Video signals vary in quality and standard; VistaBright accurately measures input signal and optimises it to produce the best levels of brightness and contrast.

XD Engine
RealCinema

The process of making a motion picture for cinema playback is different from the process used in TV. RealCinema automatically detects the presence of motion picture video and reverts the picture back to its original quality so it's possible to enjoy movie quality images on TV exactly as it was originally created.

XD Engine
OptiGrade

This technology offers a more detailed colour image reproduction. The larger the bit count, the higher the colour quality. As a result, details are more clearly visible and colour reproduction on the screen is more natural. This process occurs by the increasing number of steps from dark to light; standard 8-bit processing only offers 256 grades of brightness for each primary colour (Red, Green and Blue). OptiGrade improves this processing to 10-bit, which offers 1024 grades for each primary colour. This corresponds to an increase in the number of possible colours from ~16 million colours to a massive ~1.07 billion colours.

Plasma & LCD Main Features

HDTV High Definition Television

High Definition Television (HDTV) is the biggest revolution in television since the introduction of colour. HDTV uses the latest technology to bring viewers sharper, clearer and more vibrant pictures that makes watching television feel like you're part of the action. With compatible home cinema systems, the amazing Dolby Digital 5.1 surround sound (that is possible via High Definition), makes you feel like you are actually there.

As televisions increase in size, the lower quality standard definition signals that we have used have become noticeably lacking in detail. HDTV promises to bring video signals up to date with high tech displays on offer today.

TV pictures are made up of small coloured dots (pixels); our normal 'Standard Definition' video signals are 720 pixels wide and 576 pixels high. High Definition video signals are either 1280 pixels wide and 720 pixels high; or 1920 pixels wide and 1080 pixels high. To get the most out of HD signals – you need to have a television that is capable of displaying these pixel ratios.

HD Ready

A third party organisation called EICTA came up with a standard which allows consumers to clearly see which TVs will connect to an HDTV video source and allow them to appreciate HDTV pictures. This standard has four points that a TV must meet:

1. The TV must be a widescreen model
2. The TV must have an analogue video connection that supports HDTV (component)
3. The TV must have a digital video connection that supports HDTV and HDCP copy protection (HDMI or DVI)
4. The TV must have a minimum of 720 lines horizontal resolution.

You can easily tell which TVs meet this standard by looking for the HD Ready logo.

HDMI (High Definition Multimedia Interface)

Designed to be convenient, and improve image and video quality, HDMI can be thought of like a digital SCART connection. HDMI connections provide pure digital video, and digital audio from a device to your display. HDMI delivers sharper, cleaner images and sounds offering convenience of one cable.

Digital Tick

The Digital Tick logo indicates that a TV is ready for the digital switch over because it has an integrated digital tuner. This is sometimes referred to as a Freeview tuner or as an iDTV. TVs with this technology are able to receive all of the 30 free to air digital channels and the 10 pay TV channels from Top Up TV (Subscription and CAM required).

An aerial upgrade may be required. Digital terrestrial TV is not available in all areas – check your postcode for availability.

Freeview

Over 30 free digital TV channels including:

Please check your postcode is in a FREEVIEW coverage area. Text your postcode to 83331 (standard network charges apply), call FREEVIEW on 08708 809980 or visit www.freeview.co.uk

Plasma & LCD Main Features

Clear Filter

Plasma TVs with Clear Filter technology offer several advantages over conventional glass filters:

- Internal reflections are eliminated
- Contrast is increased by 20%
- Brightness is increased by 5%
- Weight is reduced by 20%
- Depth is reduced by 10mm

X-Studio

With X-Studio technology, your TV becomes an enormous picture frame for your digital photos via 2 slots. 9 different types of card can be used with the integrated card reader. You can also play back MP3 music files. It is even possible to set a slide show of your photos whilst playing music from your collection.

Intelligent Eye

This technology improves the perceived picture detail, contrast and colour by measuring the ambient light conditions in your room and optimising the TV picture accordingly. This gives the optimum picture quality in any environment whilst conserving energy consumption.

DCDi

(Directional Correlation De-interlacing)

DCDi is the high-quality processing circuit that provides the best quality picture for any interlaced video picture format. Created by the famous Faroudja image processing house, this technology helps to remove jagged edges by looking for diagonal lines and curves within an image and accurately reproducing them.

PIP

(Picture in Picture)

LG TVs with PIP functionality offer users the ability to display two video signals on the screen at one time. Users can freely adjust the size and position of the second window and switch between each window with the remote control.

Double Window

Similar to PIP functionality, Double Window offers users the ability to display two video signals on the screen at one time, side by side. Users can freely switch between each window with the remote control.

S-IPS

LG LCD TVs use technologically advanced Super IPS LCD panels. These panels offer several advantages over alternative LCD panel types:

- Very wide viewing angle with consistent colour reproduction
- Fast response times
- Reliable and stronger LCD panels with less damage caused by touching the screen

3D Digital Comb Filter

A comb filter is needed with many video sources to separate the colour from the brightness signals inside the TV. The 3D Digital Comb Filter used in LG TVs separates these signals clearly using a digital process eliminating edge crawls and rainbow effects. At the same time whilst extending the resolution and clearly separating colour boundaries and making images softer and cleaner.

SRS TruSurround XT

TruSurround XT is a patented technology from SRS which provides an improved listening experience by providing the perception of deep rich 3D sound from a stereo speaker system.

SRS WOW

WOW is an award winning technology from SRS that significantly enhances the quality of mono and stereo audio material.

BBE

(Base Booster Effect)

Traditional audio systems can struggle to accurately reproduce the original live recorded bass sounds, BBE works to improve this reproduction and provide reinforced strong bass sound when watching TV or listening to music.

Surround Max

Creates a 3-Dimensional enhanced sound effect by concentrating on the sounds from each left and right channel. It also works to give mono sound a special feel.

ARC

(Aspect Ratio Correction)

Video signals come in many different aspect ratios, 4:3, 16:9, 2.35:1 for example, LG TVs come with many options to make the most of these aspect ratios and ensure that you enjoy them on your 16:9 display.

PC Compatible

Inputs are provided for connecting your PC to your display to use it as a computer monitor. You can share presentations and display various media on a larger display to a larger audience than possible with a smaller monitor.

MW71PY10

Main Specification

Picture

- Resolution : Full HD (1,920 x 1,080)
- Peak Brightness : 800cd/m²
- Contrast Ratio : 1,200 : 1
- XD Engine™, 3D Digital Comb Filter
- DCDi, DLTi, DCTi

Sound

- Output : 15W x 2
- SRS TXT, BBE
- AVL

Convenience

- PIP, Double Window
